## ❖ Hotel Management System Report

### • Project Overview

The Hotel Management System is a software application designed to streamline the operations of a hotel. It provides functionalities for managing bookings, customer information, room availability, and billing. The system aims to enhance the efficiency of hotel management and improve the customer experience.

### • Objectives

To automate the booking process for customers.

To manage room availability and pricing effectively.

To maintain customer records and history.

To generate reports for management analysis.

To provide a user-friendly interface for both staff and customers.

### • Technologies Used

Programming Language: Java

IDE: NetBeans

Database Management: MySQL

Database Tool: MySQL Workbench

Frameworks/Libraries: (If any, mention here)

Operating System: (e.g., Windows, Linux)

Features

User Authentication:

Login and registration for hotel staff and administrators.

- **Room Management:**

Add, update, and delete room information.

View room availability and pricing.

Booking Management:

Create, update, and cancel bookings.

Search for available rooms based on customer requirements.

- **Customer Management:**

Store and manage customer details.

View booking history and preferences.

Billing System:

Generate invoices for customers.

Process payments and manage transactions.

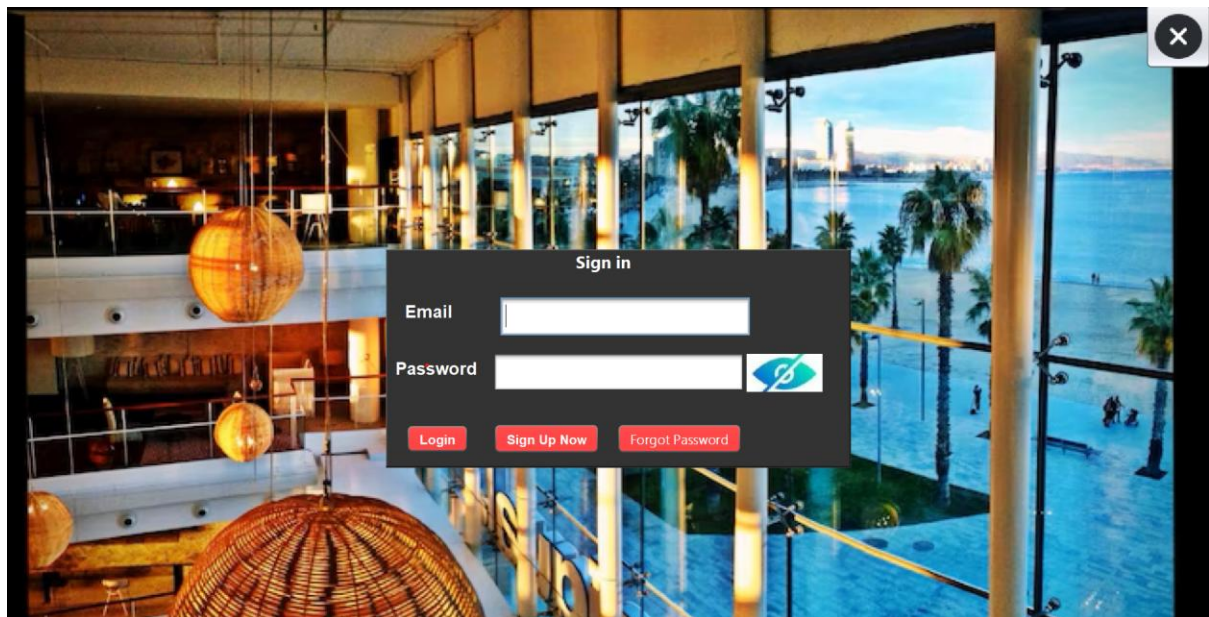

- **Reporting:**

Generate reports on bookings, revenue, and occupancy rates.

User Interface

The user interface is designed to be intuitive and user-friendly, allowing staff to navigate through the system easily. Below are some screenshots of the application:

## ❖ Database Design

The database is designed to support the functionalities of the hotel management system. Below is a brief overview of the main tables:

**Users Table:** Stores user credentials and roles.

**Rooms Table:** Contains information about room types, availability, and pricing.

**Bookings Table:** Records all booking transactions.

**Customers Table:** Maintains customer information and history.

## User Interface Implementation Steps

### • Setting Up the Project:

Open NetBeans and create a new Java project.

Set up the necessary libraries for database connectivity (e.g., MySQL Connector/J).

- **Designing the User Interface:**

Use Java Swing or JavaFX to create the GUI components.

Design the login page, dashboard, room management, booking management, and billing sections.

- **Connecting to the Database:**

Establish a connection to the MySQL database using JDBC.

Implement methods for CRUD operations (Create, Read, Update, Delete) for each table.

Implementing Functionality:

Write Java methods to handle user authentication, room management, booking processes, and billing.

Ensure that the application can handle exceptions and provide user feedback.

Testing the Application:

Test each feature thoroughly to ensure functionality and usability.

Fix any bugs or issues that arise during testing.

Finalizing the User Interface:

Polish the UI for better user experience, ensuring it is intuitive and easy to navigate.

Reporting

The reporting feature allows hotel management to generate various reports, including:

Occupancy Reports: Displays the percentage of rooms occupied over a specific period.

Revenue Reports: Summarizes total revenue generated from bookings.

Customer Reports: Lists customer details and their booking history.

These reports can be generated in a user-friendly format, allowing management to make informed decisions based on data analysis.

### ❖ Conclusion

The Hotel Management System developed using Java and MySQL provides a robust solution for managing hotel operations. By automating key processes such as booking management, room availability, and customer records, the system enhances operational efficiency and improves the guest experience. Future enhancements could include mobile access, online booking capabilities, and integration with third-party services to further streamline hotel management.
